

Project Unified Referral & Engagement (PURE) — Overlap Analysis

Generated by SCOPE

Project Unified Referral & Engagement (PURE) — Overlap Analysis

Proposal Summary

Project PURE is a whole-of-government digital platform designed to coordinate social service interventions for vulnerable families by synthesizing cross-agency data (MSF, HDB, MOE, MOH) into a unified case dashboard for public officers. It consolidates WOG client profiles, cross-agency event timelines, benefit wallets, and inter-agency referral capabilities to reduce citizen fatigue, eliminate grant duplication, and provide a single citizen-centric view across fragmented agency systems.

Overlap Summary

Product	Overlap Level	Key Finding
GatherSG	Critical	Provides near-identical officer-facing case management, inter-agency collaboration, and task tracking already supporting 17,736 users.
LifeSG	High	Directly addresses benefit visibility and service referral unification, though citizen-facing rather than officer-facing.
MyInfo	High	Provides the established WOG API architecture for authenticated multi-agency data synthesis using NRIC identifiers.
RedeemSG	Medium	Consolidates voucher tracking and reporting; overlaps partially with PURE's benefit wallet for voucher distribution.
GovWallet	Medium	Provides backend disbursement and credit management; overlaps with benefit consolidation but lacks deduplication logic.
FormSG	Low	Could support intake forms and referral workflows, but lacks the integrated case management platform PURE requires.

Detailed Analysis

GatherSG

- **Overlap:** Critical
- GatherSG provides near-identical core functionality to PURE Pillars 1 & 2. It offers centralised case management with complete visibility of citizen interactions and case histories, facilitates seamless multi-agency coordination with shared note-taking and collaborative assessments, integrates task management with progress tracking, and enables system integration to connect with other agency databases. GatherSG already supports 17,736 users across government with 99.50% uptime.
- GatherSG is a horizontal case management platform serving any agency sector. PURE is specifically scoped to social services for vulnerable families. GatherSG has video conferencing built-in; PURE does not mention this. PURE emphasizes benefit wallet consolidation and grant deduplication, which GatherSG does not address. GatherSG is already deployed; PURE would be new build.

LifeSG

- **Overlap:** High
- LifeSG directly addresses PURE Pillars 3 & 4. It provides a 'Benefits and Support' module showing all benefits a citizen has received or qualifies for—overlapping with PURE's Benefit Wallet View. It offers eligibility checkers and benefit estimators. It includes OneService features (case reporting, help neighbour, dementia alert) that function as service referral unifiers. LifeSG consolidates multi-agency benefit information and service recommendations for vulnerable populations like low-income families and seniors.
- LifeSG is citizen-facing; PURE's dashboard is officer-facing. LifeSG is not designed for inter-agency officer workflow coordination or authenticated officer-to-officer referrals with case history. LifeSG provides benefit visibility; PURE emphasizes preventing grant duplication through officer oversight. LifeSG primarily addresses citizen discovery; PURE addresses officer coordination.

MyInfo

- **Overlap:** High
- MyInfo directly supports PURE Pillar 1 (WOG Client Profile). PURE proposes pulling data via standard APIs from MSF, HDB, MOE, MOH using the citizen NRIC as core identifier—this is precisely MyInfo's architecture. MyInfo provides authenticated, consent-based data synthesis from multiple government agencies and serves 15M+ transactions monthly across 1600+ onboarded services. It eliminates repetitive citizen data entry across agencies.

- MyInfo is built for citizen-initiated, consent-based data sharing (citizen controls what is shared with which services). PURE's dashboard is officer-initiated, allowing officers to view all family data across agencies without explicit per-transaction citizen consent (though consent governance is not detailed in the proposal). MyInfo focuses on form pre-filling for transactions; PURE focuses on case management synthesis. MyInfo is citizen-facing; PURE dashboard is officer-facing.

RedeemSG

- **Overlap:** Medium
- RedeemSG addresses part of PURE Pillar 3 (Benefit Wallet View). It provides real-time tracking and reporting of voucher distributions and redemptions, ensuring transparency and preventing duplicate distributions. RedeemSG supports 7M+ vouchers claimed and \$1.49B+ spent across 63 campaigns. It consolidates benefit visibility across participating voucher schemes.
- RedeemSG is specialized for vouchers only; PURE's Benefit Wallet addresses cash, vouchers, and in-kind benefits. RedeemSG provides beneficiary and merchant portals for claiming/redeeming; PURE's wallet is officer-facing for cross-agency oversight. RedeemSG does not address inter-agency referral workflows. RedeemSG tracks redemption only; PURE must track all benefit types and prevent duplication at award time.

GovWallet

- **Overlap:** Medium
- GovWallet addresses part of PURE Pillar 3 (Benefit Wallet View). It consolidates disbursement and collection transactions across multiple agencies through a single admin portal. It supports cash payouts (GovCash), digital credits, and co-payment. It integrates with LifeSG for citizen visibility and enables agencies to manage credit usage and merchant ringfencing. GovWallet is operational with \$1B+ payouts supported.
- GovWallet is a backend disbursement/payment engine; PURE's Benefit Wallet is an officer-facing synthesis and deduplication tool. GovWallet focuses on transaction execution; PURE focuses on preventing duplicate awards. GovWallet integrates with citizen-facing apps (LifeSG); PURE's dashboard is officer-centric. GovWallet does not address officer-to-officer referrals or care coordination timelines.

FormSG

- **Overlap:** Low

- FormSG has incidental overlap with PURE's data collection and referral capabilities. It could support intake forms for social services (e.g., Family Service Centres collecting initial needs assessments) and officer-to-officer referral forms with approval workflows. FormSG's 948K+ forms and 234M+ submissions demonstrate WOG adoption.
- FormSG is a general form collection tool, not a case management platform. PURE requires real-time cross-agency case visibility and authentication for officer access; FormSG is for data submission. PURE's referral system must route cases with context; FormSG routes form submissions. FormSG does not provide the integrated timeline, benefit synthesis, or multi-agency coordination dashboard that PURE requires.

Recommendation

"Do not proceed with PURE as proposed. Redirect towards consolidation with existing platforms. 🚫"

Project PURE faces critical and high-level overlaps with three mature, production-ready WOG platforms (GatherSG, LifeSG, MyInfo) that collectively already deliver the core capabilities PURE proposes to build. Proceeding independently would result in duplication of core capabilities, fragmented benefit visibility across parallel systems, and a new silo—officers must work across both PURE and GatherSG, potentially worsening coordination rather than improving it.

Recommended Path Forward:

Start with **GatherSG specialization**. 🛠️ Work with the GatherSG product team to add social-services-specific features: benefit deduplication logic, family dependency tracking, and vulnerable-population case templates. This leverages GatherSG's existing 17,736 users and integration patterns rather than building anew.

Next, **integrate with LifeSG backend**. 🔗 Create a new officer dashboard module within GatherSG that consumes LifeSG's consolidated benefit data (via API) to give officers a read-only view of family benefits and eligibility. Avoid creating a parallel benefit wallet; integrate to GatherSG cases instead.

Enhance **referral workflows** within GatherSG. 📄 Extend GatherSG's inter-agency capabilities to formalize MSF-to-HDB, MSF-to-MOE referral workflows with case history attachment and authenticated receipt. Use GatherSG's existing system integration patterns.

Finally, **add grant deduplication as a module**. 🚫 Implement a "Grant Deduplication Module" as an add-on to GatherSG and GovWallet. This module queries multiple agency

systems (via existing APIs) to flag overlapping benefits and alert officers—without building a new platform.

Timeline & Cost: Consolidation (6–9 months, reuses infrastructure, lower operational overhead) vs. PURE standalone (18+ months, duplicates infrastructure, permanent multi-system burden). 📊

Next Step: Engage the GatherSG product team (GovTech), LifeSG team (SNDGO), and MSF stakeholders to refine requirements around social-services workflows and referral patterns. This approach delivers PURE's outcomes while avoiding costly duplication. ✅
